

### Trial Results:

- ✓ Up to 50% increase in yield
- ✓ Better quality plants
- ✓ Quicker recovery from stress

**Product:** Maxstim

**When:** Winter

**Where:** El Ejido, Spain

**Application rate:** 10L every day 15 days

Francisco Rubio grows 'Telma' variety Aubergines on his farm in El Ejido, Spain and was looking to increase the health of his yield to encourage more profitable high-quality fruit. He set up the trial using Maxstim on the plants in his oldest greenhouse where the soil is tired and used the new greenhouse to compare the results.

## New leaves after two applications of Maxstim

Once the first application was made the farmer removed the plant leaves to encourage growth in the existing fruit this, unfortunately, puts the plants into a stressful situation.

However, after 2 applications of Maxstim, the plants started recovering from this stress and new leaves started to appear.

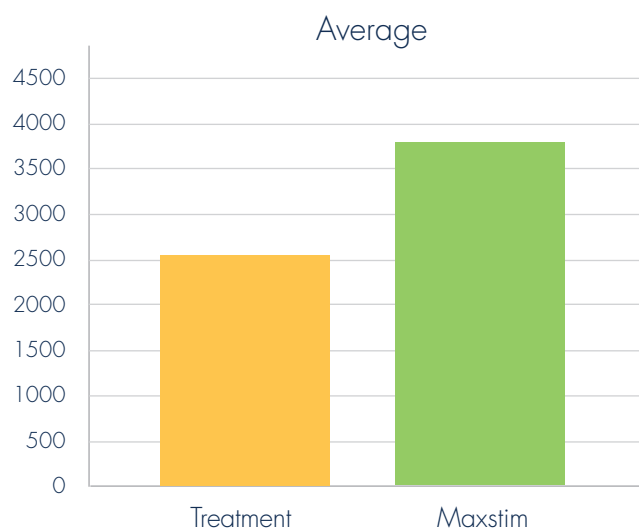

The fruits had increased growth, they showed better colour and produced noticeably higher yield for the time of year.

The grower also saw new flowers coming through ready for the next surge of fruits.

The grower was happy with the outcome of the trial, he saw Maxstim

- Increase development of fruits and new flowers on plants
- Improve yield of consistent, marketable fruit
- Boost recovery from stress

The farmer was impressed that the fruit was such great quality and brighter in colour as well as being consistent in size and yield. With over 50% more yield they are building Maxstim into their programme.
