“

After 4 weeks we started noticing some significant changes. The plants looked visibly bigger and healthier and when we examined the roots they were almost twice the size of those on the control plants. In June and July we observed thicker stems and more shoots and the berries were noticeably bigger. There was better uptake of calcium in the plants treated with Maxstim and symptoms of magnesium deficiency disappeared. At the end of the season when the leaves on the control plants were withering and falling, the treated plants were still vibrant and colourful, which indicates the plants are much more hardy. It will be amazing to see the plants at the start of the season next year, we expect them to leaf earlier and for the fruit to set earlier in the season. I am recommending all my soft fruit clients to trial Maxstim to see the benefits for themselves.
